Intermediate — a Flask app with a form — Hints

> Back to the exercise · Hint 1 · Hint 2 · Solution

- Hint 1 — one route, two methods
- Hint 2 — the template and the JSON route

Hint 1 — one route, two methods

One `/` route handles both showing the form and processing it:

```
@app.route("/", methods=["GET", "POST"])
def home():
    label = None; text = ""
    if request.method == "POST":
        text = request.form.get("text", "")
        if text.strip():
            label = classify(text)
    return render_template_string(PAGE, label=label, text=text)
```

GET shows an empty form; POST reads `request.form["text"]`, calls the pipeline, and re-renders the same page with the answer. That re-render-with-the-result is the whole trick.

Hint 2 — the template and the JSON route

The template is HTML with Jinja slots — fixed page, changing `{{ text }}` and `{{ label }}`:

```
<form method="post">
  <input name="text" value="{{ text }}"><button>Classify</button>
</form>
{% if label %}<p>Result: {{ label }}</p>{% endif %}
```

Add a JSON route for programmatic callers, and validate there:

```
@app.post("/classify")
def classify_api():
    data = request.get_json(silent=True) or {}
```

```
    if not data.get("text","").strip():
        return jsonify({"error":"empty text"}), 400
    return jsonify({"label": classify(data["text"])})
```

Test both with `app.test_client()` — no running server needed. The full code is in the Solution.
