Step 2 — Extract an Invoice From Text (the model's job) — Hints

> Back to the step · Hint 1 · Hint 2 · Solution

- Hint 1 — one chain, one method
- Hint 2 — the one line the prompt must contain

Hint 1 — one chain, one method

This is the easy step — the model does the work. `extract_invoice(model, text)` is one small chain:

```
prompt = ChatPromptTemplate.from_template(EXTRACT_PROMPT)
chain  = prompt | model.with_structured_output(Invoice)
return chain.invoke({"text": text})
```

`with_structured_output(Invoice)` (Doc04/05) makes the model return an `Invoice` object directly — no JSON string, no parsing, no `try/except`. You get a real `Invoice` every time.

Hint 2 — the one line the prompt must contain

The prompt has exactly one important instruction: **"if a field is not present, leave it empty — never invent a value."**

Without it, a missing invoice number tempts the model to make one up, and an invented value that looks plausible is the worst kind of wrong — your validator can't catch what the model fabricated. With it (and optional fields from Step 1), a missing field comes back as `None`, and Step 1's validator reports it. Structured output guarantees the *shape*; this line is what keeps the *values* honest. The whole file set is in the Solution.
