Step 3 — The Loader and the Full Pipeline (final) — Hints

> Back to the step · Hint 1 · Hint 2 · Solution

- Hint 1 — the loader: one text shape for every format
- Hint 2 — the pipeline, in three lines

Hint 1 — the loader: one text shape for every format

`load_invoice_text(path)` returns plain text whatever the file is:

- `.txt` / `.md` → `with open(path) as f: return f.read()`.
- `.pdf` → `PyPDFLoader(path).load()` (Doc08) gives one `Document` per page; join their `.page_content` with `"\n"`. (Needs `pip install pypdf`.)
- anything else → `raise UnsupportedFileError(...)`.

The point: the rest of the pipeline never cares what the file was — it always gets text.

Hint 2 — the pipeline, in three lines

`process_invoice(model, path)` is just the three pieces you already built, in order:

```
text    = load_invoice_text(path)        # Step 3
invoice = extract_invoice(model, text)   # Step 2
problems = validate_invoice(invoice)     # Step 1
return Result(invoice=invoice, problems=problems)
```

`Result` is a small `@dataclass(invoice, problems)`. `main.py` takes the path from `sys.argv`, calls `process_invoice`, and prints the fields plus any problems ("Cleared" when the list is empty). The integration test runs `samples/clean.txt` (clears) and `samples/bad_total.txt` (flagged). The whole file set is in the Solution.
