Step 1 — One Specialist's Drafting Logic, Working Alone, No Agent Behavior — Hints

> Back to this step · Hint 1 · Hint 2 · Solution

Only 2 hints — work through them in order, and don't jump ahead until you've really tried. Each hint starts with the plain idea, then shows the shape of the real code.

- Hint 1 — One specialist, one chain
- Hint 2 — The plan, and how to test it

Back to this step · Hint 1 · Hint 2 · Solution

Hint 1 — One specialist, one chain

Start with the Writer — it needs no tools. Its whole skill is: findings in, article out.

That's one Doc05 chain: a prompt, the model, and a parser, joined with `|`. No loop, no other agents, no graph.

The prompt is the Writer's job description. Say three things: the length and shape (a titled 150-250-word article), **only** the given findings, and keep each fact's `[source]` tag.

Two functions in `agents/writer_agent.py`:

- `build_writer_chain()` — `ChatPromptTemplate.from_template(load_prompt("writer")) | get_model() | StrOutputParser()`.
- `run_writer(findings: str) -> str` — builds the chain and invokes it with `{"findings": findings}`.

`run_writer()` is the one door the rest of the project will use; nothing else should touch the chain.

Bring in the shared files first: config, errors, logger, prompt loader (folder `src/prompts`), and `get_model()` from Project 3.

Hint 2 — The plan, and how to test it

```
main():
    load_config()
    for findings in TEST_FINDINGS:
        print a separator line
        print(run_writer(findings))
```

`TEST_FINDINGS` is a list of 3 made-up findings strings — two normal ones, and one almost empty.

The almost-empty input is the important one. Read what the Writer does with it:

- Good: a very short piece, or a note that there's too little to go on.
- Bad: a full article about solar panels, with facts that weren't in the input.

If it invents, make the "ONLY the findings" rule stronger now — later, Research can hand it thin notes for real, and you don't want to find this out inside the full team.
