# Intermediate (feel the speed difference) — Solution

> Back to the exercise · Hint 1 · Hint 2 · Solution

**Story — `gather_practice.py`:** reading "concurrent is faster than sequential" is not the same as timing 6 seconds against 2 seconds yourself, on the same 3 tasks — this is the exercise that turns that claim into something you measured. **If not:** every later use of `asyncio.gather` in this curriculum would rest on a speedup you took on faith instead of one you watched happen.

## Solution

```
# gather_practice.py
import asyncio
import time

async def f1():
    await asyncio.sleep(2)
    return "f1 done"

async def f2():
    await asyncio.sleep(2)
    return "f2 done"

async def f3():
    await asyncio.sleep(2)
    return "f3 done"

# One at a time: each await waits for the last to finish (~6 seconds total).
async def run_sequential():
    start = time.perf_counter()
    await f1()
    await f2()
    await f3()
    print("sequential:", time.perf_counter() - start)
```

```
# All at once: gather() runs them together (~2 seconds total).
async def run_parallel():
    start = time.perf_counter()
    await asyncio.gather(f1(), f2(), f3())
    print("parallel:", time.perf_counter() - start)

# Run both and compare the times.
asyncio.run(run_sequential())
asyncio.run(run_parallel())
```

**Expected output:**

```
sequential: 6.01
parallel: 2.01
```
