Intermediate — stream the answer — Hints

> Back to the exercise · Hint 1 · Hint 2 · Solution

- Hint 1 — a generator of tokens
- Hint 2 — forward it, don't buffer

Hint 1 — a generator of tokens

Streaming starts with a generator that `yield`s pieces of text. In a real app that's your `chain.stream(inputs)`; to practice, fake one:

```
import time
def stream_answer(text):
    for word in "this is a streamed reply".split():
        time.sleep(0.02)
        yield word + " "
```

The web layer's only job is to forward what this yields.

Hint 2 — forward it, don't buffer

- **Streamlit:** `st.write_stream(stream_answer(text))` — renders each chunk as it arrives.
- **FastAPI:** `return StreamingResponse(stream_answer(body.text), media_type="text/plain")` — the browser gets the body in chunks.
- **Flask:** `return Response(stream_answer(text), mimetype="text/plain")`.

The mistake to avoid: collecting the whole answer first (`"".join(gen)`) and then returning it — that's not streaming, the user still waits for everything. Pass the **generator itself** through. Test the FastAPI one with `TestClient`: `client.post("/stream", json={"text":"hi"}).text` assembles to the full reply. The full code is in the Solution.
