- Hint 2 — The plan

Hint 1 — The idea, synthesize not concatenate

The Writer is a plain LLM call (no tools) that turns both specialists' findings into **one** report. The whole value is in the prompt: tell it to *weave the sources together*, not stack them — and to name any source marked unavailable (so a degraded run is honest, Step 4). Add `src/agents/writer_agent.py` (`run_writer(client, task, notes_findings, web_findings, web_unavailable)`) and a real `writer_node` replacing Step 2's placeholder.

Hint 2 — The plan

```
run_writer(client, task, notes, web, web_unavailable):
    web_section = "(web page could not be reached)" if web_unavailable else web
    user = task + notes + web_section + "write the combined report"
    system = "Synthesize into ONE report; weave sources; if a source is
              unavailable, say so; never pretend it was checked."
    return chat.completions.create([system, user]).content
writer_node(state): run_writer(...) -> Command(goto=END, update={report})
```

Prove it on task 3: the report should contain at least one point that *connects* a note and the status page (e.g. "docs pending in the notes, and listed as an open risk on the status page") — something a concatenation could never produce. The whole file set is in the Solution.
