Step 3 — The Pipeline — Hints

> Back to the step · Hint 1 · Hint 2 · Solution

- Hint 1 — run_query, in order
- Hint 2 — main and the test

Hint 1 — run_query, in order

The pipeline is the pieces you built, in order:

```
run_query(model, repo_dir, question):
    collection = build_code_store(repo_dir)        # Step 1
    snippets   = retrieve_snippets(collection, q)  # Step 1
    context    = build_context(snippets)           # Step 1
    answer     = answer_question(model, q, context) # Step 2
    return answer, cited_files(snippets)           # Step 1
```

It returns both the answer and the list of files it came from — a written answer plus the places to look.

Hint 2 — main and the test

`main.py` takes a question from `sys.argv`, calls `run_query`, prints the answer and each cited file. The integration test asks "How is login handled?" and checks the answer mentions login and cites `auth.py`; a second case asks something the repo doesn't cover ("how do I train a neural network here?") and checks the answer admits it doesn't know. Keep the model at `temperature=0` so answers are repeatable. The whole file set is in the Solution.
