- Hint 1 — The idea
- Hint 2 — The plan

Hint 1 — The idea

A slow multi-round call with zero feedback is a bad tool. Return a short revision **trace** alongside the summary, so the caller can see what happened each round. Add `src/formatting.py` with two **pure** functions: `format_result(result)` (the trace + status + summary block) and `format_partial(topic, progress)` (for Step 4). Have `deep_research` return `format_result(run_pipeline(..., progress))`. Pure formatters = unit-testable with no model.

Hint 2 — The plan

```
format_result(result):
    "Deep research on: {topic}"
    "Revision trace:" + per round "  Round N: approved/rejected" + issues
    "Status: approved after N round(s)."  OR  "...stopped at the N-round cap."
    "Summary:" + result.final_summary
deep_research:
    progress = Progress()
    return format_result(run_pipeline(MODEL, topic, cap, progress))
```

Pass a `Progress` holder into `run_pipeline` now (not just for the trace — Step 4's partial reads `progress.latest_draft` on timeout). Test `format_result` on a hand-made result: it should show "Round 1: rejected / - issue / Round 2: approved" and the summary. The whole file set is in the Solution.
