Step 4 — Production Wrap (optional) — Hints

> Back to the step · Hint 1 · Hint 2 · Solution

This step is honestly closer to "go redo Project 5" than to anything new.

- Hint 1 — This is Project 5, not a new design
- Hint 2 — The one eval that actually matters here

Hint 1 — This is Project 5, not a new design

You already built this layer in Project 5 (ContentForge). Reuse it almost unchanged:

- `src/pipeline.py` — `review_diff(model, collection, diff)`: build the graph once, run it, return the compiled review (plus which reviewers ran).
- `src/api/` — `schemas.py` (`ReviewRequest` / `ReviewResponse`), `routes.py` (`POST /review`, `GET /health`), `main.py` (`FastAPI` app).
- `Dockerfile` — the same slim-python image from Project 5.

The only real change from Project 5 is *what the pipeline does inside* — a 4-agent review instead of a writer/reviewer loop. The wrapper is identical.

Hint 2 — The one eval that actually matters here

A suite that only checks each reviewer's accuracy could pass even if routing were completely broken — every reviewer running on every diff would still produce correct findings. So the eval that matters checks **routing**:

```
docs-only diff   -> "security" NOT in reviewers_run
code-with-secret -> "security" IN reviewers_run AND review mentions the secret
```

That's the point of the whole project — the routing — so that's what the eval guards. Test the API with the pipeline faked (monkeypatch `review_diff`) so it runs with no model and no key. The whole file set is in the Solution.
